## PROBLEM 1:

Derive wavelet decomposition of a signal using m-adic Haar wavelets.

## Solution:

First let us obtain the m-adic Haar wavelets. Let the basis of $V_{j}$ be $\left\{\phi\left(m^{j} t-k\right)\right\}_{k=-\infty}^{\infty}$, where,

$$
\phi\left(m^{j} t-k\right)= \begin{cases}1 & \frac{k}{m^{j}} \leq t<\frac{k+1}{m^{j}} \\ 0 & \text { else }\end{cases}
$$

Note that $\phi\left(m^{j} t-k\right)=\sum_{a=0}^{m-1} \phi\left(m^{j+1} t-m k+a\right)$. As it needs m signals in $V_{j+1}$ to obtain $V_{j}$, thus the dimensionality of $V_{j+1}$ with respect to $V_{j}$ is m . Thus, we need $m-1$ wavelets to obtain $V_{j+1}$ using $V_{j}$. Let us define the wavelets in $W_{0}$ as follows:

$$
\psi_{i}(t)= \begin{cases}x & 0 \leq t<\frac{i}{m}  \tag{1}\\ y_{i} & \frac{i}{m} \leq t<\frac{i+1}{m} \\ 0 & \text { else }\end{cases}
$$

As we need the wavelets to be orthogonal to each other, consider $\psi_{i}(t)$ and $\psi_{j}(t)$, where $i<j$, then,

$$
\begin{aligned}
\int_{-\infty}^{\infty} \psi_{i}(t) \psi_{j}(t) d t & =0 \\
\Longrightarrow \frac{x^{2} i}{m}+\frac{x y_{i}}{m} & =0 \\
\Longrightarrow \frac{x i+y_{i}}{m} & =0
\end{aligned}
$$

As we need the wavelets to be orthogonal to $\phi(t)$,

$$
\begin{aligned}
\int_{-\infty}^{\infty} \phi(t) \psi_{i}(t) d t & =0 \\
\Longrightarrow \frac{x i}{m}+\frac{y_{i}}{m} & =0 \\
\Longrightarrow \frac{x i+y_{i}}{m} & =0
\end{aligned}
$$

Thus, considering $x=1 \Longrightarrow y_{i}=-i$. Thus,

$$
\psi_{i}(t)= \begin{cases}1 & 0 \leq t<\frac{i}{m} \\ -i & \frac{i}{m} \leq t<\frac{i+1}{m} \\ 0 & \text { else }\end{cases}
$$

These form the basis of the wavelet space $W_{0}$. Note that $\left|\psi_{j}(t)\right|^{2}=\int_{-\infty}^{\infty} \psi_{j}^{2}(t) d t=\frac{j(j+1)}{m}$. Let us denote this by $\alpha_{j}^{2}$. As $\phi(t)$ and $\left\{\psi_{j}(t)\right\}_{j=1}^{m-1}$ are orthogonal and lie in $V_{1}$, they form a basis for $V_{1}$ as it has dimension of $m$. Thus, we can represent $\phi(m t)$ as follows:

$$
\phi(m t)=a_{0} \phi(t)+\sum_{i=1}^{m-1} a_{i} \psi_{i}(t) .
$$

where the coefficients are obtained as follows:

$$
\begin{aligned}
a_{0} & =\langle\phi(m t), \phi(t)\rangle \\
a_{i} & =\frac{1}{\alpha_{i}}\left\langle\phi(m t), \psi_{i}(t)\right\rangle
\end{aligned}
$$

In general,

$$
\left\langle\phi(m t-j), \psi_{i}(t)\right\rangle= \begin{cases}\frac{1}{m} & j<i \\ \frac{-i}{m} & j=i \\ 0 & j>i\end{cases}
$$

Thus, $a_{i}=\frac{1}{m \alpha_{i}}$ As we have obtained $V_{1}$ from $V_{0}$ and $W_{0}$, we can similarly obtain the higher resolution subspaces and obtain a wavelet decomposition.
Generalization: The wavelets in $W_{j}$ are given by,

$$
\psi_{i}\left(m^{j} t\right)= \begin{cases}1 & 0 \leq t<\frac{i}{m^{j+1}} \\ -i & \frac{i}{m^{j+1}} \leq t<\frac{i+1}{m^{j+1}} \\ 0 & \text { else }\end{cases}
$$

Note that $\left|\psi_{j}(t)\right|^{2}=\int_{-\infty}^{\infty} \psi_{j}^{2}(t) d t=\frac{j(j+1)}{m^{j}}$. Let us denote this by $\alpha_{j}^{2}$. As $\phi\left(m^{j} t\right)$ and $\left\{\psi_{k}\left(m^{j} t\right)\right\}_{k=1}^{m-1}$ are orthogonal and lie in $V_{j+1}$, they form a basis for it as it has dimension of $m$. Thus, we can represent $\phi\left(m^{j+1} t\right)$ as follows:

$$
\phi\left(m^{j+1} t\right)=a_{0} \phi\left(m^{j} t\right)+\sum_{i=1}^{m-1} a_{i} \psi_{i}\left(m^{j} t\right)
$$

where the coefficients are obtained as follows:

$$
\begin{aligned}
a_{0} & =\frac{1}{m^{j}} \\
a_{i} & =\frac{1}{m^{j} \alpha_{i}}
\end{aligned}
$$

## PROBLEM 2:

Let $W_{j}$ be the space of all functions with basis $\psi\left(2^{j} t-k\right)$ where $k \in \mathbb{Z}$. Prove $V_{j+1}=V_{j} \oplus W_{j}$. (5 points)

## Solution:

Any element in $V_{j+1}$ is given by:

$$
f(t)=\sum_{l=-\infty}^{\infty} a_{l} \phi\left(2^{j+1} t-l\right)
$$

The basis function is given by:

$$
\phi\left(2^{j+1} t-k\right)= \begin{cases}1 & \frac{k}{2^{j+1}} \leq t<\frac{k+1}{2^{j+1}} \\ 0 & \text { else }\end{cases}
$$

Let us consider the basis functions $\phi\left(2^{j} t-k\right)$ and $\psi\left(2^{j} t-k\right)$ of $V_{j}$ and $W_{j}$ respectively, then,

$$
\begin{aligned}
& \phi\left(2^{j} t-k\right)= \begin{cases}1 & \frac{k}{2^{j}} \leq t<\frac{k+1}{2^{j}} \\
0 & \text { else }\end{cases} \\
& \psi\left(2^{j} t-k\right)= \begin{cases}1 & \frac{k}{2^{j}} \leq t<\frac{k}{2^{j}}+\frac{1}{2^{j+1}} \\
-1 & \frac{k}{2^{j}}+\frac{1}{2^{j+1}} \leq t<\frac{k+1}{2^{j+1}} \\
0 & \text { else }\end{cases}
\end{aligned}
$$

Thus, if $l$ is odd,

$$
\phi\left(2^{j+1}-l\right)=\frac{\phi\left(2^{j} t-\frac{l-1}{2}\right)-\psi\left(2^{j} t-\frac{l-1}{2}\right)}{2}
$$

Thus, if $l$ is even,

$$
\phi\left(2^{j+1}-l\right)=\frac{\phi\left(2^{j} t-\frac{l}{2}\right)+\psi\left(2^{j} t-\frac{l}{2}\right)}{2}
$$

Thus,

$$
\begin{aligned}
f(t) & =\sum_{l=-\infty}^{\infty} a_{l} \phi\left(2^{j+1} t-l\right)=\sum_{l=-\infty}^{\infty} a_{2 l}\left(\phi\left(2^{j} t-l\right)+\left(\psi\left(2^{j} t-l\right)\right)+\sum_{l=-\infty}^{\infty} a_{2 l+1}\left(\phi\left(2^{j} t-l\right)-\left(\psi\left(2^{j} t-l\right)\right)\right.\right. \\
& =\sum_{l=-\infty}^{\infty}\left(a_{2 l}+a_{2 l+1}\right) \phi\left(2^{j} t-l\right)+\left(a_{2 l}-a_{2 l+1} \psi\left(2^{j} t-l\right)\right)
\end{aligned}
$$

Thus, every signal can be expressed in basis of $V_{j}$ and $\psi_{j}$ which are orthogonal to each other. Thus, the direct sum of the two spaces add upto $V_{j+1}$.

## PROBLEM 3:

Obtain the Haar wavelet decomposition for the signal $f(t)$ using the Haar basis. Indicate the signal dimension at each subspace. Sketch the waveforms explicitly at each subspace. Obtain the reconstructed signal in functional form after nulling out any spike of $(1 / 8)^{\text {th }}$ unit of time. Analyze using Fourier Transform. How much of energy is lost in the recovered signal?(10 points)

$$
f(t)= \begin{cases}3 & 0 \leq t<\frac{1}{4} \\ -1 & \frac{1}{4} \leq t<\frac{3}{8} \\ 2 & \frac{3}{8} \leq t<\frac{5}{8} \\ 0 & \frac{5}{8} \leq t<1\end{cases}
$$

## Solution:

The maximum resolution of the function is $\left(\frac{1}{8}\right)^{\text {th }}$ unit of time. The function can be written

| Level | Signal Dimension |
| :---: | :---: |
| 1 | 2 |
| 2 | 4 |
| 3 | 5 |
| 4 | 5 |

Table 1: Signal Dimension
as:

$$
\begin{aligned}
f(t) & =3 \phi(8 t)+3 \phi(8 t-1)-\phi(8 t-2)+2 \phi(8 t-3)+2 \phi(8 t-4) \\
& =\frac{3}{2}(\phi(4 t)+\psi(4 t))+\frac{3}{2}(\phi(4 t)-\psi(4 t))-\frac{1}{2}(\phi(4 t-1)+\psi(4 t-1))+(\phi(4 t-1)-\psi(4 t-1))+(\phi(4 t- \\
& =3 \phi(4 t)+\frac{1}{2} \phi(4 t-1)-\frac{3}{2} \psi(4 t-1)+\phi(4 t-2)+\psi(4 t-2) \\
& =\frac{3}{2}(\phi(2 t)+\psi(2 t))+\frac{1}{4}(\phi(2 t)-\psi(2 t))+\frac{1}{2}(\phi(2 t-1)+\psi(2 t-1))-\frac{3}{2} \psi(4 t-1)+\psi(4 t-2) \\
& =\frac{7}{4} \phi(2 t)+\frac{5}{4} \psi(2 t)+\frac{1}{2}(\phi(2 t-1)+\psi(2 t-1))-\frac{3}{2} \psi(4 t-1)+\psi(4 t-2) \\
& =\frac{7}{8}(\phi(t)+\psi(t))+\frac{5}{4} \psi(2 t)+\frac{1}{2}\left(\frac{1}{2}(\phi(t)-\psi(t))+\psi(2 t-1)\right)-\frac{3}{2} \psi(4 t-1)+\psi(4 t-2) \\
& \left.=\frac{9}{8} \phi(t)+\frac{5}{8} \psi(t)+\frac{5}{4} \psi(2 t)+\psi(2 t-1)\right)-\frac{3}{2} \psi(4 t-1)+\psi(4 t-2)
\end{aligned}
$$

The signal dimension at each level is: After nulling out the $\left(\frac{1}{8}\right)^{\text {th }}$ spike but suppressing $\psi(4 t-1)$ and $\psi(4 t-2)$, we obtain,

$$
\begin{aligned}
g(t)= & \left.\frac{9}{8} \phi(t)+\frac{5}{8} \psi(t)+\frac{5}{4} \psi(2 t)+\frac{1}{2} \psi(2 t-1)\right) \\
= & \frac{9}{8} \phi(4 t)+\frac{9}{8} \phi(4 t-1)+\frac{9}{8} \phi(4 t-2)+\frac{9}{8} \phi(4 t-3)+\frac{5}{8} \phi(4 t)+\frac{5}{8} \phi(4 t-1)-\frac{5}{8} \phi(4 t-2) \\
& -\frac{5}{8} \psi(4 t-3)+\frac{5}{4} \phi(4 t)-\frac{5}{4} \phi(4 t-1)+\frac{1}{2} \phi(4 t-2)-\frac{1}{2} \phi(4 t-3) \\
= & 3 \phi(4 t)+\frac{1}{2} \phi(4 t-1)+\phi(4 t-2) \\
& \begin{cases}3 & 0 \leq t<\frac{1}{4} \\
\frac{1}{2} & \frac{1}{4} \leq t<\frac{1}{2} \\
1 & \frac{1}{2} \leq t<\frac{3}{4} \\
0 & \frac{3}{4} \leq t<1\end{cases}
\end{aligned}
$$

$$
\text { Energy lost }=\int_{-\infty}^{\infty} f^{2}(t)-g^{2}(t) d t
$$

$$
=\left(\frac{1}{4} \times 3^{2}+\frac{1}{8} \times(-1)^{2}+\frac{1}{4} \times 2^{2}-\left(\frac{1}{4} \times 3^{2}+\frac{1}{4} \times\left(\frac{1}{2}\right)^{2}+\frac{1}{4} \times 1^{2}\right)\right.
$$

$$
=\frac{27}{8}-\frac{41}{16}=\frac{13}{16}
$$

Fourier Analysis:

$$
G(f)=\frac{3}{4} \operatorname{sinc}\left(\frac{f}{4}\right) \mathrm{e}^{\frac{-j 2 \pi f}{8}}+\frac{1}{8} \operatorname{sinc}\left(\frac{f}{4}\right) \mathrm{e}^{\frac{-j 6 \pi f}{8}}+\frac{1}{4} \operatorname{sinc}\left(\frac{f}{4}\right) \mathrm{e}^{\frac{-j 10 \pi f}{8}}
$$
